

Hortonsphere[®]

PRESSURE VESSELS

www.cbi.com

CB&I pioneered the concept of field-welding spheres in the 1920s and built the world's first field-erected Hortonsphere vessel in 1923. Since then, we have designed and built thousands of spheres around the world, including liquid spheres up to 94 feet (28.6 m) in diameter and gas spheres up to 110 feet (33.5 m) in diameter. We built the world's largest self-supporting sphere, measuring 225 feet (69 m) in diameter nuclear plant containment vessel in New York.

Ensuring the health and safety of our employees, customers and the community is a core value of CB&I. We uphold this value in the same way it ensures the quality of our work—implementing rigorous controls through every phase of our projects. CB&I is firmly committed to operating all of its facilities and projects in a safe, efficient manner and in compliance with applicable safety, health, and environmental laws, rules, and regulations. Many customers seek our input early in project development, enabling us to deliver long-term value with project-specific solutions. We ensure quality throughout the project, from our engineering design to the materials we select and by our expertise in welding and non-destructive testing of weld joints, including x-ray, ultrasonic and others, as necessary.

Our vast experience has given us a strong technical base and a foundation for continuous improvement of spheres and their related systems. Our civil, structural and mechanical engineers, together with our project managers and craftspeople, strive to optimize every component of a project. From a standard storage sphere to a complete turnkey terminal, We have the ability to work with customers to solve their complex and challenging project needs.

Ambient & Low Temperature Liquid Storage

The most common use for the Hortonsphere vessel is ambient temperature liquid storage. This method uses high stress advantages of the spherical shape to minimize wall thickness. Products stored in ambient and low temperature Hortonsphere vessels include:

- Gasoline
- Anhydrous ammonia
- Vinyl Chloride Monomer
- Naphtha
- Propane
- Propylene
- Ethane
- Butane
- Natural Gas Liquids
- Butadiene

Many of these products can also be stored at low temperatures by lowering the design pressure. A balance can be found between ambient temperature storage which uses full pressure with no refrigeration and fully refrigerated storage at atmospheric pressure. The vessel design pressure is lowered by 150 to 200 psig (10.3 to 13.8 barg), translating into lower cost vessels and larger storage capacities. Partially refrigerated Hortonsphere vessels are single-wall vessels with an external insulation system.

Cryogenic Temperature Liquid Storage

Hortonsphere vessels for cryogenic storage are fully refrigerated double-wall spheres with an evacuated, perlite-filled annular space. Cryogenic product storage requires boil-off vapor handling or liquefaction systems that can also be provided. Products stored in cryogenic Hortonsphere vessels include:

- LNG
- Methane
- Ethylene
- Hydrogen
- Oxygen

Gas Storage

Hortonsphere pressure vessels are commonly used by municipalities to store natural or manufactured gas and at sewage treatment plants for digester gas. They are also used in the petroleum, chemical and aerospace industries to store gases such as:

- Hydrogen
- Nitrogen
- Oxygen
- Helium
- Argon

Turnkey Terminal Projects

In addition to the spheres themselves, we furnish turnkey terminal facilities. Over the years, we have provided engineering, procurement and construction services for hundreds of marine, pipeline, rail and highway terminals. We can design and build the entire terminal facility, including infrastructure.

Other Uses

- Space chambers
- Hyperbaric chambers
- Environmental chambers
- Vacuum vessels
- Process vessels
- Test vessels
- Containment vessels
- Surge vessels

Optional Features

In addition to the standard features of a sphere, we can provide optional features such as:

- Water deluge systems
- Firewater spray systems
- Foundations
- Insulation
- Pressure relief and vacuum relief valves

Surface and Volume of Spheres

Notes: If diameters are assumed as meters, values in columns "Surface of Sphere in Square Feet" and "Volume of Sphere in Cubic Feet" will represent Surface of Sphere in Square Meters and Volume of Sphere in Cubic Meters respectively. Surface Area of sphere = $3.141593 D^2$ Square Feet. Volume of sphere = $0.523599 D^3$ Cubic Feet., = $0.093257 D^3$ Barrels of 42 U.S. Gallons. Numbers of barrels of 42 U.S. Gallon at any inch in a true sphere = $(3d-2h)h^2 \times .0000539681$ where d is diameter of sphere and h is depth of liquid in inches.

CB&I is the world's leading designer and builder of storage facilities, tanks, and terminals. With more than 60,000 structures completed throughout its 135+ year history, CB&I has the global expertise and strategically located operations to provide its customers world-class storage solutions for even the most complex energy infrastructure projects. CB&I is owned by a consortium of financial investors led by Mason Capital Management. To learn more, visit www.cbi.com.
